Content-Type: The Silent Negotiator Between Client and Server!

Whenever you send or receive data through APIs, Content-Type defines the language of the conversation. Without it, the server and client would be just guessing!

Here are the most common Content-Type values you must know:

- 1 application/json – Most used for REST APIs and modern web apps.
- 2 application/xml – Used where XML structured data is needed.
- 3 multipart/form-data – Essential for file uploads.
- 4 application/x-www-form-urlencoded – Classic form submissions.
- 5 text/html – Sending HTML code.
- 6 text/plain – Plain text responses.
- 7 application/pdf – Downloadable PDF files.
- 8 application/octet-stream – Used for arbitrary binary data.
- 9 application/graphql – Specific to GraphQL queries.
- 10 image/jpeg, image/png – For sending images.
