

EF Cyre

EF Core Trick: View EF Core's Full Picture

```
userEntity.Name = user.Name;
userEntity.Email = user.Email;
userEntity.IsActive = user.IsActive;
string before = _dbContext.ChangeTracker.DebugView.LongView;
_dbContext.Users.Update(userEntity);
string after = _dbContext.ChangeTracker.DebugView.LongView;
                           Text Visualizer
                                                                       • 🗆 X
await _dbContext.Save Expression: _dbContext.ChangeTracker.DebugView.LongView
                            String manipulation:
                                          None
                            Value:
                            User {UserId: 1} Modified
throw new Exception("
                               UserId: 1 PK
                               Address: 'Valsad' Modified
                               Email: 'john@xyz.com' Modified Originally
                            'ajay@xyz.com'
                               IsActive: 'True' Modified
                               Name: 'John' Modified Originally 'Ajay'
```

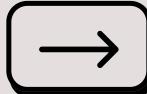

1. ShortView:

```
User? userEntity = await _dbContext.Users.
    FirstOrDefaultAsync(u => u.UserId == user.UserId);
string firstTracked = _dbContext.ChangeTracker.DebugView.ShortView;
                                 Text Visualizer
                                                                          \square \times
if (userEntity is not null)
                                 Expression: _dbContext.ChangeTracker.DebugView.ShortView
                                 String manipulation: None
    userEntity.Name = user.N
                                  Value:
    userEntity.Email = user.
                                 User {UserId: 1} Unchanged
    userEntity.IsActive = us
                                 ✓ Word Wrap
    string before = _dbConte
    _dbContext.Users.Update(userEntity);
    string after = _dbContext.ChangeTracker.DebugView.LongView;
    await _dbContext.SaveChangesAsync();
```

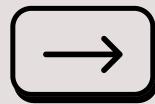

2. LongView:

```
userEntity.Name = user.Name;
 userEntity.Email = user.Email;
 userEntity.IsActive = user.IsActive;
 string before = _dbContext.ChangeTracker.DebugView.LongView;
 _dbContext.Users.Update(userEntity);
 string after = _dbContext.ChangeTracker.DebugView.LongView;
                            Text Visualizer
                                                                        ▼ 🗖 X
 await _dbContext.Save Expression: _dbContext.ChangeTracker.DebugView.LongView
                             String manipulation:
                                           None
;e
                             Value:
                             User {UserId: 1} Modified
 throw new Exception(
                                UserId: 1 PK
                                Address: 'Valsad' Modified
                                Email: 'john@xyz.com' Modified Originally
                             'ajay@xyz.com'
                                IsActive: 'True' Modified
                                Name: 'John' Modified Originally 'Ajay'
```
